CNB090产品介绍 CNB090 Brief Description

CNB090轴承是以高密度铜合金(CuSn6.5P0.1/CuSn8P0.3)为基体材质卷制而成的具有承载能力大,耐磨性能好的特点。基于铜易加工的良好性能和先进的工装模具,CNB090轴承可以在带材表面加工出适应各种工况条件的油穴(标准产品为菱形油穴),油槽等,使轴承在使用中可储存大量的润滑油脂,在工作初期形成油膜,降低摩擦系数,工作中延长加油间隔周期,有效提高轴承使用寿命。与传统的铜套相比,CNB090轴承具有密度高、薄壁、低重、负载压力大、长寿命,经济等优点,主要应用于农业机械、森林机械、工程机械、采矿机械等领域。

CNB090 bronze wrapped bushings are made of entirely bronze CuSn6.5 -P0.1/CuSn8P0.3. Because of material properties, the working surface rolled with diamond Indentations(standard Indentations) or stamped oil grooves according to detailed application. And it also has good Performance of anti-corrosion caused by chemical and environments. During the operation, the grease and oil will be released from the Indentations,which allow for longterm lubrication. Compare with Machined bronze bearings;CNB090 can offer some advantages including thin wall, lower weight, cheaper cost, high load etc. It is suitable for high load, lower speed application like construction, Transport, and agriculture machinery.

CNB092产品介绍 CNB092 Brief Description

CNB092轴承是以(CuSn6.5P0.1/CuSn8P0.3)为基体材质,表面排布规则的油孔,可在装配前或装配后涂抹油脂,以便在工作中易形成转移油膜,降低摩擦系数。具有油脂储存量大、免维护周期长等优点;产品被广泛应用于农业机械、森林机械、工程机械等。

CNB092 is deriving from CNB090;the difference between Cn090 and CNB092 is indentations on working surface,which substituted by Through-holes,these holes will allow greater capacity to collect lubricant,which build up a lubrication film at the start of movement and reduce the friction.it is suitable for high load ,lower speed application like constrycction ,Transport, and agricult ure machinery.

轴承的选型

Bushing Design

与轴承寿命有关的六个因素：

载荷P[N/mm]Load

载荷越大，轴承使用寿命越短；载荷波动越大，对轴承寿命的影响也越大，轴承寿命越短；无论在任何情况下，最大载荷不可超过理论最大允许负载值。载荷大小等于实际工作载荷除以轴承的投影面积，公式为 $P=F/(D \cdot B)$ 。

V[m/s]与PV值

Velocity & PVValue 轴承的工作寿命取决于 PV 值的大小，即实际负 P[N/mm] 与滑动速度 V[m/s] 乘积， PV 越小，轴承寿命越长。

温度T/Temture

轴承的寿命也取决于轴承使用时的温度，因此在设计选型时应尽量考虑相关部件的散热特性。

对磨部件的表面粗糙度

Ra Roughness of Mating Surface 与轴承对磨的部件接触面粗糙度应在 Ra0.2~Ra0.8 之间，轴承在装配和使用的过过程中不可有锐利的介质损坏轴承的工作表面。

使用寿命

对磨部件表面材料，对磨部件表面粗糙度时影响轴套使用寿命的一个因素，一般情况下某表面要求达到 $s0.4\text{umka}$ 。

其他因素

如轴承座的设计、润滑条件等。

Factors of bushing service life:

(1) Operation load is an important factor for bushing service life and static load is beneficial for it. Generally, the specific load determined by the type of loading, and should not exceed the theoretical value. Specific load obtained from operation load divided by the projected area of bushing.

(2) Bushing service life is determined by PV Value, $PV = PxV$. PV value is smaller, service life of bushing is longer.

(3) Environment temperature and Thermal Generated from the different movements like Oscillating, rotary & reciprocating will influence the bushing-service life. There is higher thermal expansion rate with poor thermal conductivity. It is necessary to control the bushing size and clearance.

(4) The roughness of mating surfaces should be Ra0.2~Ra0.8. During the process of installing, the sharp burr set for bidden to damage the mating surface.

(5) Material of Mating Surface will affect the service life of bushing. The mating surface finish should be $s0.4\text{umka}$.

(6) Other factors like Design of housing, Lubrication condition etc.

轴套座孔设计 Housing Design

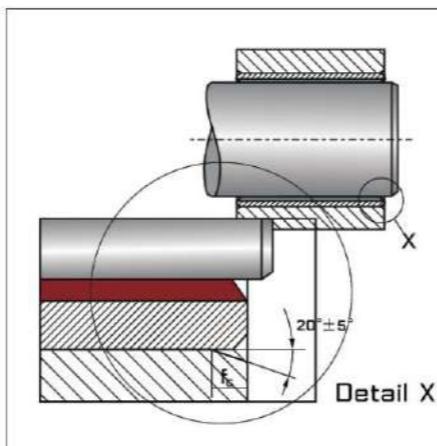

直套装配设计

为了更易于装配,轴承的座孔均应有一个倒角,如表。

$d_g \leq 30$	0.8 ± 0.3
$30 < d_g \leq 80$	1.2 ± 0.4

卷制轴套检测

Wrapped Bushing Measurement

在自由状态下,卷制类轴套有一定的开口缝,不能精确的测量外径和内径。所以,卷制类轴承的内外径应有专业的测量工具和设备进行。

In free state,wrapped bushing will not be closed,which is impossible to accurately measure External diameter and internal diameter.When wrapped bushing Measured, special gauges and test equipments is necessary.

外径检测

Test external diameter ISO 3547-2 TEST B

轴套用力压入环规通规(最大加力250N)通过
Press the bushing into Go ring gange.Hnd
push bushing through by hand(Max.force 250N)

用上述同样方法和相同力压入环规止端不通过
Use the above same way and press,bushing can not go into No Go ring
gauge

内径检测

Test internal diameter IS3547-2 TEST C

当轴套压入环规,塞规通端通过用较小力,塞规止端通过用较大力不超过250N
Press the bushing into ring gauge.The Go plugauge could be inserted by a
light pressure.The No Go Pluggauge could not be inserted by heavy
pressure(Max.force 250N)

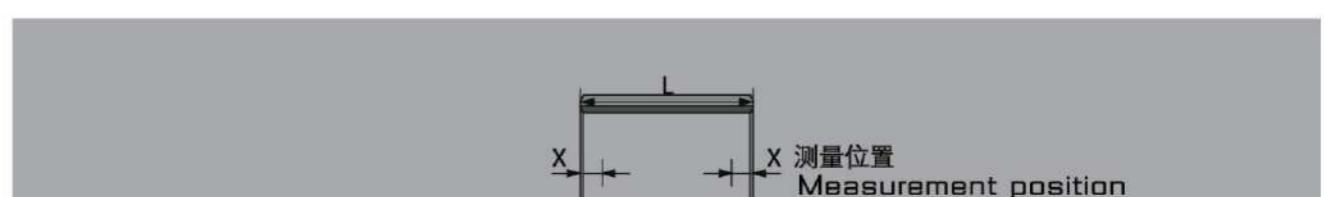

注意:轴套压入环规,轴套外径可能会永久减小Note:When the bushing is
pressed into ring gauge,external diameter could be permanent reduction

壁厚测量

Wall thickness Meaurement

轴套壁厚测量:按轴套高度在轴套轴向上测量一点,两点或三点。

The wall thickness of bushing is measured by profession gauge at
one,two,or three positions according to bushing length
